Hi,

Your post provides a clear and compelling analysis of the *ACM Malware Disruption* case study, and you effectively connect Rogue's behaviour to key ACM Code principles such as 1.1, 1.2, and 2.8. Your integration of the BCS Code of Conduct strengthens your argument by showing that the ethical breaches are consistent across multiple professional frameworks. I also found your discussion of weak jurisdictional laws insightful, especially your use of Brenner (2010) to highlight how national legal gaps enable transnational cybercrime.

A particular strength of your post is the balanced discussion of the worm used to dismantle the botnet. You acknowledge the ethical ambiguity, noting that while the intention aligned with public good, the method risked violating privacy and harming legitimate users an important point about proportionality and unintended consequences.

To enhance your analysis further, you could briefly expand on how actions may be ethically justified from a utilitarian perspective yet still violate professional codes rooted in duty or rights-based ethics. Additionally, offering a short example of international cooperation mechanisms—such as cross-border cybercrime treaties or shared CERT coordination would strengthen your concluding question.

Overall, your post is thoughtful, well-referenced, and raises important considerations about ethical practice in global cybersecurity contexts.
